Command line

You can run PlantUML using the command line. (See [running](#) for ways to run PlantUML from various other

The most basic way to run it is:

```
java -jar plantuml.jar file1 file2 file3
```

This will look for @startXYZ into file1 , file2 and file3 . For each diagram, a .png file will be created

For processing a whole directory, you can use:

```
java -jar plantuml.jar "c:/directory1" "c:/directory2"
```

This command will search for @startXYZ and @endXYZ into .txt , .tex , .java , .htm , .html , .c .hh or .md files of the c:/directory1 and c:/directory2 directories.

Docker images are released as [Github Packages](#) and to [Docker Hub](#).

```
docker run ghcr.io/plantuml/plantuml
```

Wildcards

You can also use wildcards :

- For a single character, use ?
- For zero or more characters, use *
- For zero or more characters, (including / or \), use a double **

So to process any .cpp files in all directories starting by dummy :

```
java -jar plantuml.jar "dummy*/*.cpp"
```

And to process any .cpp files in all directories starting by dummy, and theirs subdirectories :

```
java -jar plantuml.jar "dummy*/**.cpp"
```

Excluded files

You can exlude some files from the process using the -x option:

```
java -jar plantuml.jar -x "***common/**" -x "***test/Test*" "dummy*/**/*.cpp"
```

Output Directory

You can specify an output directory for all images using the `-o` switch:

```
java -jar plantuml.jar -o "c:/outputPng" "c:/directory2"
```

If you recurse into several directory, there is a slight difference if you provide an absolute or a relative path for

- An absolute path will ensure that all images are output to a single, specific, directory.
- If you provide a relative path then the images is placed in that directory relative to the location of the **in** even if the path begins with a `.`). When Plantuml processes files from multiple directores then the com computed output directory.

Types of Output File

Images for your diagrams can be exported in a variety of different formats. By default the format will be a PN following extensions:

Param name	Short param name	Output format	Comment
-tpng	-png	PNG	Default
-tsvg	-svg	SVG	Further details can be found here
-teps	-eps	EPS	Further details can be found here
-teps:text	-eps:text	EPS	This option keeps text as text
-tpdf	-pdf	PDF	Further details can be found here
-tvdx	-vdx	VDX	Microsoft Visio Document
-txmi	-xmi	XMI	Further details can be found here
-tscxml	-scxml	SCXML	
-thtml	-html	HTML	Alpha feature: do not use
-ttxt	-txt	ATXT	ASCII art. Further details can be found
-tutxt	-utxt	UTXT	ASCII art using Unicode characters
-tlatex	-latex	LATEX	Further details can be found here
-tlatex:nopreamble	-latex:nopreamble	LATEX	Contains no LaTeX preamble creating
-tbraille	-braille	PNG	Braille image <i>[Ref. QA-4752]</i>

Example:

```
java -jar plantuml.jar yourdiagram.txt -ttxt
```

Configuration File

You can also provide a configuration file which will be included before each diagram:

```
java -jar plantuml.jar -config "./config.cfg" dir1
```

последовательность прецедентов классов активности активности **UML** компонент состояний объек

- If you do not want plantuml to save the diagram's source code in the generated PNG metadata, you can use the `-nometadata` option to disable this functionality (To NOT export metadata in PNG/SVG generated files).
- It is possible to retrieve this source with the `-metadata` option. This means that the PNG is almost "self-contained", as you cannot install plugins, and someone in the future can update the diagram by getting the metadata, even if the diagram is a stand-alone.
- Conversely, the `-checkmetadata` option checks whether the target PNG has the same source and if it does, it skips the processing step, thus saving all processing time. This allows you to run PlantUML on a whole folder (or tree with the `-recurse` option).

Sounds like magic! No, merely clever engineering :-)

Example:

```
java -jar plantuml.jar -metadata diagram.png > diagram.puml
```

Unfortunately this option works only with local files. It doesn't work with `-pipe` so you cannot fetch a URL directly.

However, the Plantuml [server](#) has a similar feature, where it can get a PNG from a URL and extract its metadata.

Exit code

When there are some errors in diagrams the command returns an error (-1) exit code. But even if some diagrams are generated, which can be time consuming for large projects.

You can use the `-failfast` flag to change this behavior to stop diagram generations as soon as one error occurs, even if some will not.

There is also a `-failfast2` flag that does a first checking pass. If some error is present, no diagram will be generated, which is even faster than `-failfast`, which may be useful for huge projects.

Standard report [stdrpt]

Using the `-stdrpt` (standard report) option, you can change the format of the error output of your diagram. 

With this option, a different error output of your diagram is possible:

- none: two lines
- `-stdrpt`: single line
- `-stdrpt:1`: verbose
- `-stdrpt:2`: single line

[Ref. [Issue#155](#) and [QA-11805](#)]

Examples, with the bad file `file1.pu`, where `as` is written `aass`:

```
@startuml
participant "Famous Bob" as Bob
@enduml
```

Without any option

```
java -jar plantuml.jar file1.pu
```

The error output is:

```
Error line 2 in file: file1.pu
Some diagram description contains errors
```

-stdrpt option

```
java -jar plantuml.jar -stdrpt file1.pu
```

The error output is:

-  В начало
-  Что нового ?
-  Быстрый старт
-  Online Server
-  Запуск
-  F.A.Q.
-  Скачать
-  Форум
-  Theme
-  Препроцессинг
-  Стандартная библиотека
-  Hitchhiker's Guide
-  PDF Guide

-stdrpt:1 option

```
java -jar plantuml.jar -stdrpt:1 file1.pu
```

The error output is:

```
protocolVersion=1
status=ERROR
lineNumber=2
label=Syntax Error?
Error line 2 in file: file1.pu
Some diagram description contains errors
```

-stdrpt:2 option (like -stdrpt)

```
java -jar plantuml.jar -stdrpt:2 file1.pu
```

The error output is:

```
file1.pu:2:error:Syntax Error?
```

✖ Standard Input & Output

Using the `-pipe` option, you can easily use PlantUML in your scripts.

With this option, a diagram description is received through standard input and the PNG file is generated to standard output.

Example:

```
cat somefile.puml | java -jar plantuml.jar -pipe > somefile.png
```

The `-pipemap` option can be used to generate PNG map data (hyperlink rectangles) for use in HTML, eg:

```
cat somefile.puml | java -jar plantuml.jar -pipemap > somefile.map
```

The map file looks like this:

```
<map id="plantuml_map" name="plantuml_map">
<area shape="rect" id="id1" href="http://plantuml.com" title="http://plantuml.com"
alt="" coords="1,8,88,44"/>
</map>
```

Note: Also take a look at `-pipedelimiter` and `-pipeNoStderr` to implement proper multiplexing of several diagrams, and error handling.

✖ Help

You can have a help message by launching :

```
java -jar plantuml.jar -help
```

This will output:

-  В начало
-  Что нового ?
-  Быстрый старт
-  Online Server
-  Запуск
-  F.A.Q.
-  Скачать
-  Форум
-  Theme

-  Стандартная библиотека
-  Hitchhiker's Guide
-  PDF Guide

```
(to execute the GUI)
or java -jar plantuml.jar [options] [file/dir] [file/dir] [file/dir]
(to process files or directories)

You can use the following wildcards in files/dirs:
*      means any characters but '\'
?      one and only one character but '\'
**     means any characters (used to recurse through directories)

where options include:
-darkmode      To use dark mode for diagrams
-gui           To run the graphical user interface
-tpng         To generate images using PNG format (default)
-tsvg        To generate images using SVG format
-tps         To generate images using EPS format
-tpdf        To generate images using PDF format
-tvdx        To generate images using VDX format
-txmi        To generate XMI file for class diagram
-tscxml       To generate SCXML file for state diagram
-thtml       To generate HTML file for class diagram
-ttxt        To generate images with ASCII art
-tutxt       To generate images with ASCII art using Unicode characters
-tlatex      To generate images using LaTeX/Tikz format
-tlatex:nopreamble To generate images using LaTeX/Tikz format without preamble
-o[output] "dir" To generate images in the specified directory
-DVAR1=value  To set a preprocessing variable as if '!define VAR1 value' were used
-Sparam1=value To set a skin parameter as if 'skinparam param1 value' were used
-Ppragma1=value To set pragma as if '!pragma pragma1 value' were used
-I\path\to\file To include file as if '!include file' were used
-I\path\to\*.puml To include files with pattern
-theme xxx    To use a specific theme
-charset xxx  To use a specific charset (default is windows-1251)
-e[x]clude pattern To exclude files that match the provided pattern
-metadata     To retrieve PlantUML sources from PNG images
-nometadata   To NOT export metadata in PNG/SVG generated files
-checkmetadata Skip PNG files that don't need to be regenerated
-version      To display information about PlantUML and Java versions
-v[erbose]    To have log information
-quiet        To NOT print error message into the console
-debugsvk     To generate intermediate svk files
-h[elp]       To display this help message
-testdot      To test the installation of graphviz
-graphvizdot "exe" To specify dot executable
-p[ipe]       To use stdin for PlantUML source and stdout for PNG/SVG/EPS {
-encodesprite 4|8|16[z] "file" To encode a sprite at gray level (z for comp
-computeurl|-encodeurl To compute the encoded URL of a PlantUML source file
-decodeurl    To retrieve the PlantUML source from an encoded URL
-syntax       To report any syntax error from standard input without gener
-language     To print the list of PlantUML keywords
-checkonly    To check the syntax of files without generating images
-failfast     To stop processing as soon as a syntax error in diagram occur
-failfast2    To do a first syntax check before processing files, to fail
-noerror      To skip images when error in diagrams
-duration     To print the duration of complete diagrams processing
-nbthread N   To use (N) threads for processing
-nbthread auto To use 4 threads for processing
-timeout N    Processing timeout in (N) seconds. Defaults to 15 minutes (90
-author[s]    To print information about PlantUML authors
-overwrite    To allow to overwrite read only files
-printfonts   To print fonts available on your system
-enablestats  To enable statistics computation
-disablestats To disable statistics computation (default)
-htmlstats   To output general statistics in file plantuml-stats.html
-xmlstats    To output general statistics in file plantuml-stats.xml
-realtimestats To generate statistics on the fly rather than at the end
-loopstats   To continuously print statistics about usage
-splash      To display a splash screen with some progress bar
-progress     To display a textual progress bar in console
-pipeimageindex N To generate the Nth image with pipe option
-stdlib      To print standard library info
-extractstdlib To extract PlantUML Standard Library into stdlib folder
-filedir xxx  To behave as if the PlantUML source is in this dir (only affe
-filename "example.puml" To override %filename% variable
-preproc     To output preprocessor text of diagrams
-cypher      To cypher texts of diagrams so that you can share them
-picoweb     To start internal HTTP Server. See https://plantuml.com/picoweb
```

If needed, you can setup the environment variable GRAPHVIZ_DOT.
